Neurology & Diagnostic Imaging

Patient Name	Anita Yadav
Age / Gender	48 Years / Female
Patient ID	AMH-2026-07432
Referring Physician	Dr. Rajeev Khanna
Sample Type	MRI Brain / Contrast Study
Report Date	26-Sep-2026

MRI Brain – Contrast Enhanced

Observation	Finding
Brain parenchyma	A well-defined intra-axial mass lesion is identified in the right frontal lobe, measuring approximately 4.1 × 3.6 cm.
Signal characteristics	The lesion demonstrates heterogeneous signal intensity with areas of surrounding edema.
Post-contrast study	Heterogeneous enhancement is noted following contrast administration.
Mass effect	Mild effacement of adjacent cortical sulci with approximately 4 mm leftward midline shift.
Ventricular system	No hydrocephalus is identified.
Additional findings	No acute intracranial hemorrhage or extra-axial collection is seen.

Impression

Imaging features are suggestive of a right frontal lobe brain neoplasm with surrounding vasogenic edema and mild mass effect. Further characterization and correlation with clinical findings are advised. Neurosurgical/neurology consultation is recommended.

Clinical Note

The reported lesion requires specialist assessment and correlation with the complete imaging study and clinical history.
